Handbook on Enterprise Architecture

From SEBoK
Handbook on Enterprise Architecture

Usage

This source is considered a primary reference for the Enterprise Systems Engineering article.

Annotation

The Handbook is intended to serve as a guide to enterprise engineers and other practitioners responsible for, or involved with, architecting in an enterprise context. The work is divided into five parts as follows:

- Part II provides guidance with strategy making and business planning.
- Part III presents modeling as a means for defining the requirements for enterprise change.
- Part IV moves forward from requirements to developing the master plan – architectural design of the changed enterprise with techniques for architecting the desired change.
- Part V is a series of case studies that utilize the guidance from the previous sections.

As a collection of articles focusing on enterprise expression and transformation throughout its life time while undergoing several life cycles within and across its constituent systems, the practitioner is provided with many useful methods and references to many more. The concepts presented apply equally well for other approaches. This Handbook provides both breadth and depth in addressing the topic of enterprise architecture and the engineering of enterprise interoperability.
