Stakeholder needs and requirements represent the views of those at the business or enterprise operations level—that is, of users, acquirers, customers, and other stakeholders as they relate to the problem (or opportunity), as a set of requirements for a solution that can provide the services needed by the stakeholders in a defined environment. Using enterprise-level life cycle concepts (see Business or Mission Analysis for details) as guidance, stakeholders are led through a structured process to elicit stakeholder needs (in the form of a refined set of system-level life-cycle concepts). Stakeholder needs are transformed into a defined set of Stakeholder Requirements, which may be documented in the form of a model, a document containing textual requirement statements or both.

Stakeholder requirements play major roles in systems engineering, as they:

- Form the basis of system requirements activities.
- Form the basis of system validation and stakeholder acceptance.
- Act as a reference for integration and verification activities.
- Serve as means of communication between the technical staff, management, finance department, and the stakeholder community.

This topic describes the definition of stakeholder needs and requirements which involves the activities necessary to elicit and prioritize the needs of the stakeholder(s), and transform those needs into a set of defined stakeholder requirements. Defining the problem or the issue to be solved, identifying the opportunity for developing a new solution, or improving a system-of-interest (SoI) must begin prior to starting the activities necessary to define stakeholder needs and requirements. This means that an initial context of use of the new or modified mission, operation, or capability has already been characterized (see Business or Mission Analysis). System requirements are considered in detail during system definition. None of the above can be considered complete until consistency between the two has been achieved, as demonstrated by traceability, for which a number of iterations may be needed.

Purpose and Definition

The purpose of the Stakeholder Needs and Requirements definition activities are to elicit a set of clear and concise needs related to a new or changed mission for an enterprise (see mission analysis (MA) for information relevant to identifying and defining the mission or operation), and to transform these stakeholder needs into verifiable stakeholder requirements.

Stakeholders may well begin with desires, and expectations that may contain vague, ambiguous statements that are difficult to use for SE activities. Care must be taken to ensure that those desires and expectations are coalesced into a set of clear and concise need statements that are useful as a start point for system definition. These need statements will then need to be further clarified and translated into more engineering-oriented language in a set of stakeholder requirements to enable proper architecture definition and requirement activities. As an example, a need or an expectation such as, to easily manoeuvre a car in order to park, will be transformed in a set of stakeholder requirements to a statement such as, increase the driviability of the car, decrease the effort for handling, assist the piloting, protect the coachwork against shocks or scratches, etc.

To allow a clear description of the activities of stakeholder needs and requirements to be described, a generic view of the business teams and roles involved in a typical enterprise has been used below, tThis includes teams such as business management and business operations;, and roles including requirements engineer and business analyst. For an overview of these roles and how they enable both stakeholder and business requirements across the layers of a typical enterprise see Life Cycle Processes and Enterprise Need.

Principles and Concepts

Identifying Stakeholders

Stakeholders of a SoI may vary throughout the life cycle. Thus, in order to get a complete set of needs and subsequent requirements, it is important to consider all stages of the life cycle model when identifying the stakeholders or classes of stakeholders.

Every system has its own stages of life, which typically include stages such as concept, development, production, operations, sustainment, and retirement (for more information, please see Life Cycle Models). For each stage, a list of all stakeholders having an interest in the future system must be identified. The goal is to get every stakeholder’s point of view for every stage of the system life in order to consolidate a complete set of stakeholder needs that can be prioritized and transformed into the set of stakeholder requirements as exhaustively as possible. Examples of stakeholders are provided in Table 1.

Table 1. Stakeholder Identification Based on Life Cycle Stages. (SEBoK Original)
Identifying Stakeholder Needs

Once business management is satisfied that their needs and requirements are reasonably complete, they pass them on to the business operations team. Here, the Stakeholder Needs and Requirements (SNR) Definition Process uses the ConOps, or Strategic Business Plan (SBP), and the life-cycle concepts as guidance. The requirements engineer (RE) or business analyst (BA) leads stakeholders from the business operations layer through a structured process to elicit stakeholder needs—in the form of a refined OpsCon (or similar document) and other life-cycle concepts. The RE or BA may use a fully or partially structured process to elicit specific needs, as described in models such as user stories, use cases, scenarios, system concepts, and operational concepts.

Identifying Stakeholder Requirements

Stakeholder needs are transformed into a formal set of stakeholder requirements, which are captured as models or documented as textual requirements and output typically called a Stakeholder Requirement Specification (StRS), Stakeholder Requirement Document (StRD) or similar. That transformation should be guided by a well-defined, repeatable, rigorous, and documented process of requirements analysis. This requirements analysis may involve the use of functional flow diagrams, timeline analysis, N2 Diagrams, design reference missions, modeling and simulations, movies, pictures, states and modes analysis, fault tree analysis, failure modes and effects analysis, and trade studies.

Collecting Stakeholder Needs and Requirements

There are many ways to collect stakeholder needs and requirements. It is recommended that several techniques or methods be considered during elicitation activities to better accommodate the diverse set of sources, including:

- Structured brainstorming workshops
- Interviews and questionnaires
- Technical, operational, and/or strategy documentation review
- Simulations and visualizations
- Prototyping
- Modeling
- Feedback from verification and validation processes,
- Review of the outcomes from the system analysis process (ISO/IEC 2015)
- Quality function deployment (QFD) - can be used during the needs analysis and is a technique for deploying the “voice of the customer”. It provides a fast way to translate customer needs into requirements. (Hauser and Clausing 1988)
- Use case diagrams (OMG 2010)
- Activity diagrams (OMG 2010)
From the Capture of Stakeholder Needs to the Definition of Stakeholder Requirements

Several steps are necessary to understand the maturity of stakeholder needs and to understand how to improve upon that maturity. Figure 1 presents the cycle of needs as it can be deduced from Professor Shoji Shiba’s and Professor Noriaki Kano’s works and courses, and is adapted here for systems engineering (SE) purposes.

Figure 1 shows the steps and the position of the stakeholder requirements and system requirements in the engineering cycle. Below are explanations of each stage of requirements (Faisandier 2012); to illustrate this, consider this example of a system related to infectious disease identification:

- **Real needs** are those that lie behind any perceived needs (see below); they are conditioned by the context in which people live. As an example, a generic need could be the ability to *identify infectious diseases easily.* Often, real needs appear to be simple tasks.

- **Perceived needs** are based on a person’s awareness that something is wrong, that something is lacking, that improvements could be made, or that there are business, investment, or market opportunities that are not being capitalized upon. Perceived needs are often presented as a list of organized expectations resulting from an analysis of the usage conditions for the considered action (see Business or Mission Analysis). Following from the infectious disease example above, the real need might be perceived as a need to *carry out medical tests in particular circumstances (laboratories, points of care, hospitals, and/or human dispensaries).* Since the real need is seldom clearly expressed, richness of the knowledge of the perceived needs is used as a basis for potential solutions. This step has to be as complete as possible to cover all the contexts of use.

- **Expressed needs** originate from perceived needs in the form of generic actions or constraints,
and are typically prioritized. In the example, if safety is the primary concern, the expressed need to protect the operator against contamination may take priority over other expressed needs such as assist in the execution of tests. When determining the expressed needs, the analysis of the expected mission or services in terms of operational scenarios takes place.

- **Retained needs** are selected from the expressed needs. The selection process uses the prioritization of expressed needs to achieve a solution or to make attaining solutions feasible. The retained needs allow the consideration of potential solutions for a SoI. These retained stakeholder intentions do not serve as stakeholder requirements, since they often lack definition, analysis, and possibly consistency and feasibility. Using the concept of operations to aid the understanding of the stakeholder intentions at the organizational level and the system operational concept from the system perspective, requirements engineering leads stakeholders from those initial intentions to structured and more formal stakeholder requirement statements, ISO/IEC/IEEE 29148 Systems and software engineering - Requirements engineering (ISO 2011). Characteristics of good requirements can be found in (ISO 2011). Exploration of potential solutions must start from this step. The various solutions suggested at this step are not yet products, but describe means of satisfying the stakeholder requirements. Each potential solution imposes constraints on the potential future SoI.

- **Specified needs**, are the translation of the stakeholder needs to represent the views of the supplier, keeping in mind the potential, preferred, and feasible solutions. Specified needs are translated into system requirements. Consistent practice has shown this process requires iterative and recursive steps in parallel with other life cycle processes through the system design hierarchy (ISO 2011).

- **Realized needs** are the product, service, or enterprise realized, taking into account every specified need (and hence, the retained needs).

Each class of needs listed above aligns with an area of the SE process. For example, the development of specified needs requirements is discussed in the System Requirements topic. For more information on how requirements are used in the systems engineering process, please see the System Definition knowledge area (KA).

**Classification of Stakeholder Requirements**

Several classifications of stakeholder requirements are possible, e.g. ISO/IEC 29148, section 9.4.2.3 (ISO 2011) provides a useful set of elements for classification. Examples of classification of stakeholder requirements include: service or functional, operational, interface, environmental, human factors, logistical, maintenance, design, production, verification requirements, validation, deployment, training, certification, retirement, regulatory, environmental, reliability, availability, maintainability, design, usability, quality, safety, and security requirements. Stakeholders will also be faced with a number of constraints, including: enterprise, business, project, design, realization, and process constraints.

**Process Approach**

**Activities of the Process**

Major activities and tasks performed during this process include the following:

- Identify the stakeholders or classes of stakeholders across the life cycle.
- Elicit, capture, or consolidate the stakeholder needs, expectations, and objectives as well as any constraints coming from the mission and business analysis processes.
- Refine the OpsCon and other life-cycle concepts (acquisition concept, deployment concept, support concept, and retirement concept).
- Prioritize the stakeholder needs.
- Transform the prioritized and retained stakeholder needs into stakeholder requirements.
- Verify the quality of each stakeholder requirement and of the set of stakeholder requirements using the characteristics of good requirements identified in the System Requirements article.
- Validate the content and the relevance of each stakeholder requirement with corresponding stakeholder representatives providing rationale (glossary) for the existence of the requirement.
- Identify potential risks (or threats and hazards) that could be generated by the stakeholder requirements (for further information, see Risk Management).
- Synthesize, record, and manage the stakeholder requirements and potential associated risks.

**Artifacts, Methods and Modeling Techniques**

This process may create several artifacts, such as:

- Recommendations to refine the Business Requirement Specification (if necessary)
- Refined life-cycle concepts (OpsCon, acquisition concept, deployment concept, support concept, and retirement concept)
- Stakeholder requirements (in the form of a model or a document containing textual requirements, such as the Stakeholder Requirement Specification)
- Stakeholder interview reports
- Stakeholder requirements database
- Stakeholder requirements justification documents (for traceability purposes)
- Input for draft verification and validation plans

The content, format, layout and ownership of these artifacts will vary depending on who is creating them and in which domains they will be used. Between these artifacts and the outputs of the process, activities should cover the information identified in the first part of this article.

**Practical Considerations**

Major pitfalls encountered with stakeholder requirements are presented in Table 3.

<table>
<thead>
<tr>
<th>Pitfall</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Operator Role Not Considered</strong></td>
<td>Sometimes engineers do not take into account the humans acting as operators inside a system or those who use the system and are outside of the system. As a consequence, elements are forgotten (e.g. roles of operators).</td>
</tr>
<tr>
<td><strong>Exchanges with External Objects Forgotten</strong></td>
<td>The exhaustiveness of requirements can be an issue; in particular, the interfaces with external objects of the context of the system can be forgotten (exchanges of matter, energy, information).</td>
</tr>
<tr>
<td><strong>Physical Connections with External Objects Forgotten</strong></td>
<td>Within the interface issue, physical connections of the system-of-interest with external objects can be forgotten (technological constraints).</td>
</tr>
<tr>
<td><strong>Forgotten Stakeholders</strong></td>
<td>Stakeholders can be forgotten, as everyone thinks of direct users, customers, and suppliers; however, one may fail to consider those who do not want the system to exist and malevolent persons.</td>
</tr>
</tbody>
</table>

Proven practices with stakeholder requirements are presented in Table 4.

</tbody>
</table>
Involve Stakeholders
Involve the stakeholders early in the stakeholder requirements development process.

Presence of Rationale
Capture the rationale for each stakeholder requirement.

Analyze Sources before Starting
Complete stakeholder requirements as much as possible before starting the definition of the system requirements.

Modeling Techniques
Use modeling techniques as indicated in sections above.

Requirements Management Tool
Consider using a requirements management tool. This tool should have the capability to trace linkages between the stakeholder requirements and the system requirements and to record the source of each stakeholder requirement.
